

THE DIGITAL MAILROOM — IN AND OUT

Mail-IQ

Scan the post in. Send personalised mail out. Always know what came back.

One platform for a whole organisation's mail. Inbound: scan the day's post once and it's split, classified, routed to the right person and filed into your systems. Outbound: turn one document into a personalised mailshot delivered by post, email or SMS — with a closed loop that tells you exactly who has responded.

Your mailroom, both directions, in one place

Six things Mail-IQ does out of the box. Everything after this is a walk through the screens that deliver them and how you switch each one on.

Digital mailroom

Scan a batch of incoming post once — Mail-IQ splits it at separator sheets, reads each document, classifies it, and routes it to the right mailbox.

Files into your systems

Legal letters filed into Proclaim named by matter reference; invoices forwarded to your AP system — read off the document, no re-keying.

Personalised campaigns

One document → a personalised copy for every recipient, each addressed and stamped with a unique QR — a mailshot in one click.

Post, email & SMS

Each recipient is reached the way they prefer — a letter in the post, a tracked email, or a text with a secure link — decided from your data.

Closed-loop returns

When a document comes back — scanned in by post, or uploaded to the recipient portal — Mail-IQ registers who responded. Reconciliation, automatic.

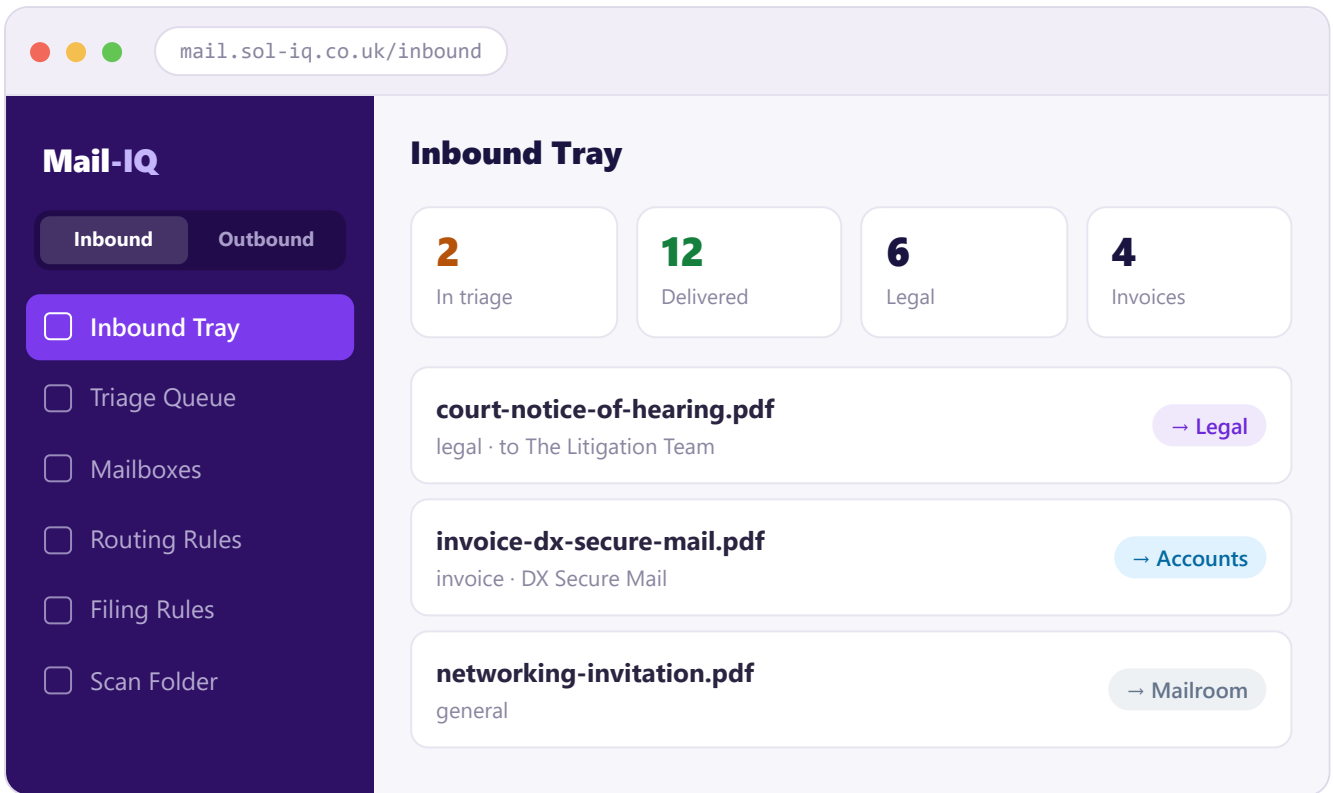

Cloud or on-premise

Run it hosted, or entirely inside your own network for compliance — with a signed licence and per-module control.

A morning's post, sorted before anyone touches it

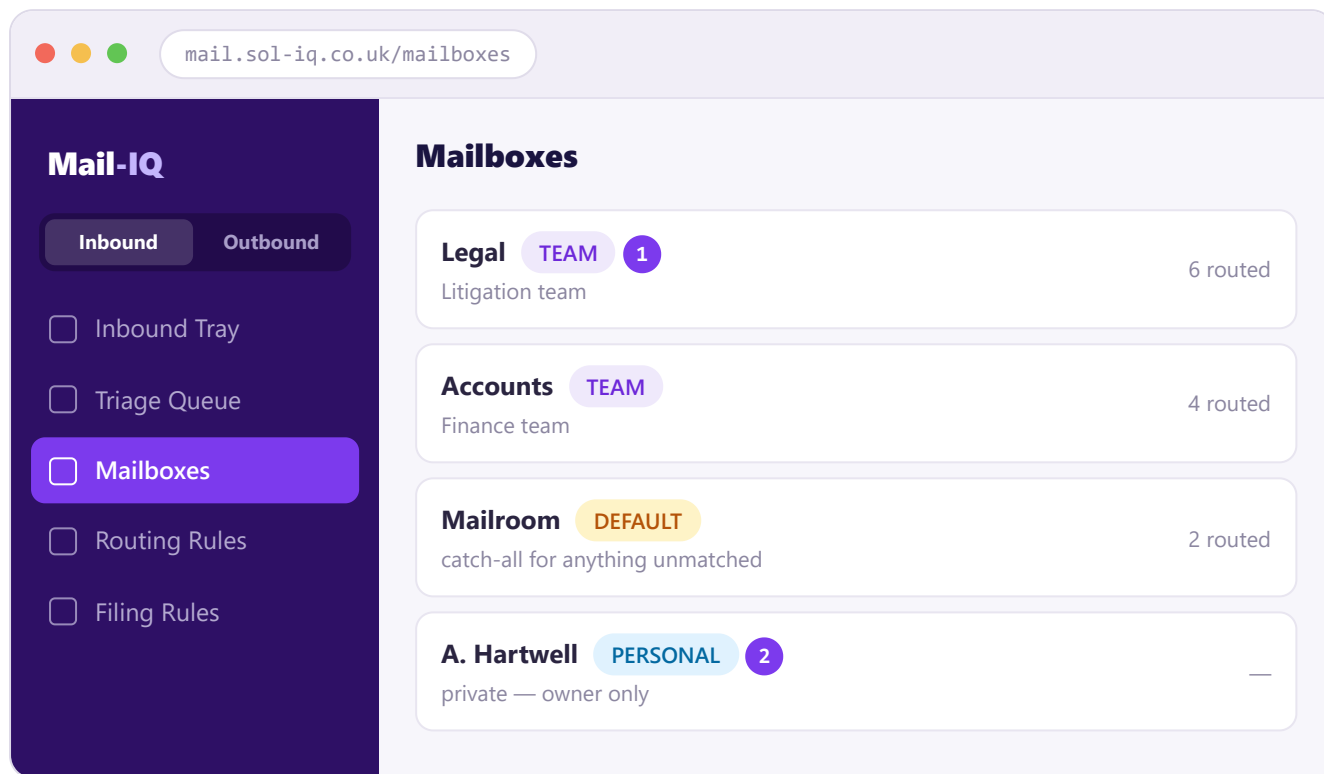

Scan the day's post as one file. Mail-IQ splits it into individual documents at the QR separator sheets, works out what each one is, and routes it to the right mailbox — the whole tray classified and delivered in seconds.

- 1 **One scan in.** Staff scan the day's post into a hot folder; a small agent splits the batch at QR separator sheets — the only new step in the routine.
- 2 **Classified automatically.** Each document is read and typed — legal, invoice, statement, general — with genuinely scanned post handled by built-in OCR.
- 3 **Routed to a mailbox.** Rules send each document to the right team's mailbox; anything unrecognised waits safely in triage. People only see the post that's theirs.

To the right team — and only the right team

Mailboxes are the internal destinations post is routed to: shared team boxes and private personal ones. Routing rules decide, by document type and keyword, which box each item lands in — and anything unmatched waits safely in triage rather than going astray.

1 Team boxes. Shared inboxes for Legal, Accounts and so on; everyone in the team sees the post, and an administrator can too.

2 Personal & private. Everyone gets a personal inbox that only they can read — an administrator can see it exists, but never its contents.

3 Routing rules & triage. Rules match on document type and keyword (highest priority wins) to pick a box; anything unrecognised parks in the triage queue so nothing is ever lost.

Straight into Proclaim and your AP system, correctly named

The real time-saver. A filing rule reads a reference off the document — a matter number, an invoice — and drops the correctly-named file into a watch folder your other systems already monitor. Case management and accounts payable, fed automatically.

Target folder

- 1 Named by reference.** Mail-IQ finds the matter reference on a legal letter and files it as, say, BRN-2024-0142.pdf — ready for Proclaim to ingest.
- 2 Forward mode.** Invoices need no reference — leave the format blank and they're forwarded straight to an Invoice-IQ hot folder for automated AP.
- 3 Per-client formats.** Each client's reference pattern is typed once as a simple mask (# = a digit); the agent writes the file into whichever watch folder you map on that PC.

One list — and each person's own way of being reached

Your audience lives here. Import a spreadsheet or add people by hand; each recipient carries their address, email, mobile and — the key field — a delivery preference. That preference is what routes every future mailing to post, email or SMS automatically.

1 Delivery preference per person. Post, email, SMS or auto (Mail-IQ picks the best available). Set it once and every campaign honours it — no sorting into piles.

2 Import in seconds. Upload a CSV of your customers or members; matching records update rather than duplicate, so re-imports stay clean.

3 Everything on one record. Address, account number, email and mobile live together — the address feeds the window envelope, the email and mobile feed the digital channels.

One document, a personalised copy for everyone — by preference

Upload a ready-made letter, or compose one with merge fields. Mail-IQ produces an individually-addressed copy for each recipient, attaches any enclosures, stamps a unique QR, and sends each one the way that person prefers — post, email or SMS.

New campaign

Upload a PDF Compose a letter **1**

Body

Thank you for banking with us, {firstName}. Your account {account} is due for its annual review this {date}...

☒ Add return QR **2** + Attach map insert

3 Will send to 10 recipients — 3 email, 2 SMS, 4 post, 1 auto.

Create & send

- 1 Upload or compose.** Bring a finished PDF (address & QR are overlaid), or type a letter with {firstName}, {account}, {postcode} tokens and Mail-IQ personalises the body for every recipient.
- 2 Unique QR per copy.** Each letter carries its own QR — an opaque code, no personal data printed — so a returned document can be matched back to that exact recipient.
- 3 Routed by preference.** Post, email or SMS is chosen from each recipient's record — one action, three channels, and a count of each before you send.

Every postal copy, batched and print-ready

The recipients set to post don't need handling one by one. Mail-IQ collects them into a batch and generates a single print-ready PDF — each page already carrying the recipient's address in the window position and its unique QR. Hand it to any printer or franking machine, then mark it printed and posted.

▣ Mark posted ³

Recipient	Postcode	Pages
Thomas Boyle	G1 2JK	1
Daniel Osei	S1 2NO	1
Helen Marsh	NE1 4PQ	2

1 Batched automatically. Postal copies from your campaigns collect into a dated print run — no exporting or collating by hand.

2 One print-ready PDF. Generate the whole run as a single file; every page is addressed in the window position and carries its unique QR, ready for the printer.

3 Printed & posted. Mark the run printed, then posted — so you always know what has physically gone out, and when.

Send it digitally — and let them send everything back

Recipients reached by email or SMS get a link to their own secure page — like an insurer sending your policy documents to a portal. They view and download what you sent, then upload their response — and any supporting documents — together in one go. Think of a job applicant returning the completed form with their passport photo, driving licence and certificates.

Send 3 documents 2

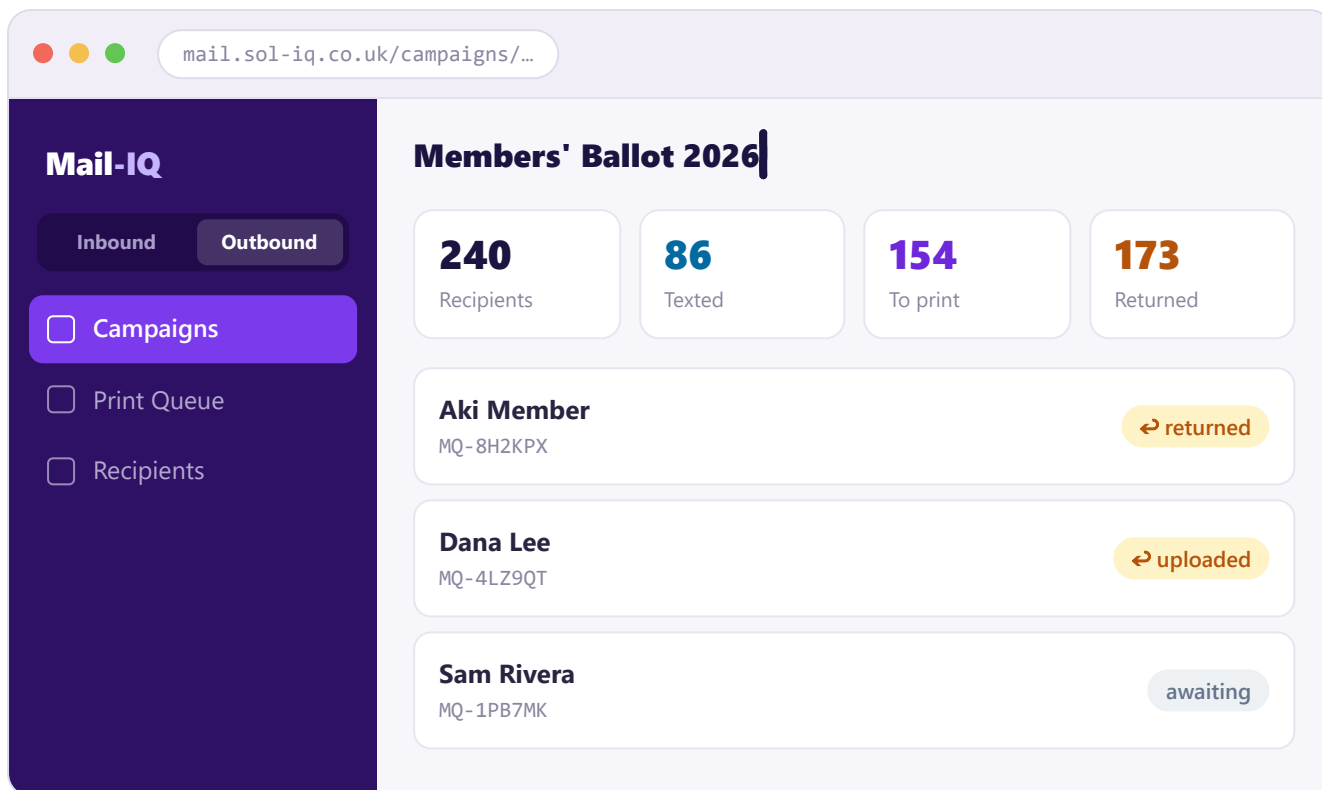

1 Secure, per-recipient link. A unique unguessable link — no login, no personal data in the address. When they opened and downloaded is recorded on the audit trail.

2 Multiple documents, one go. The completed form plus supporting documents — photo, licence, certificates — uploaded together (up to 10 files); everything is stored against their record and marks them as responded.

3 Sent by SMS or email. The same portal is reached from a texted link or an email button — whichever channel the recipient prefers — and the sender sees every returned file on the campaign dashboard.

Know exactly who has responded — on paper or online

The part that sets Mail-IQ apart. A returned document — a ballot, a form, a renewal — comes back either way: posted back and scanned through the inbound mailroom, or uploaded to the portal. Both land in the same place, so you can see at a glance who's replied and chase only who hasn't.

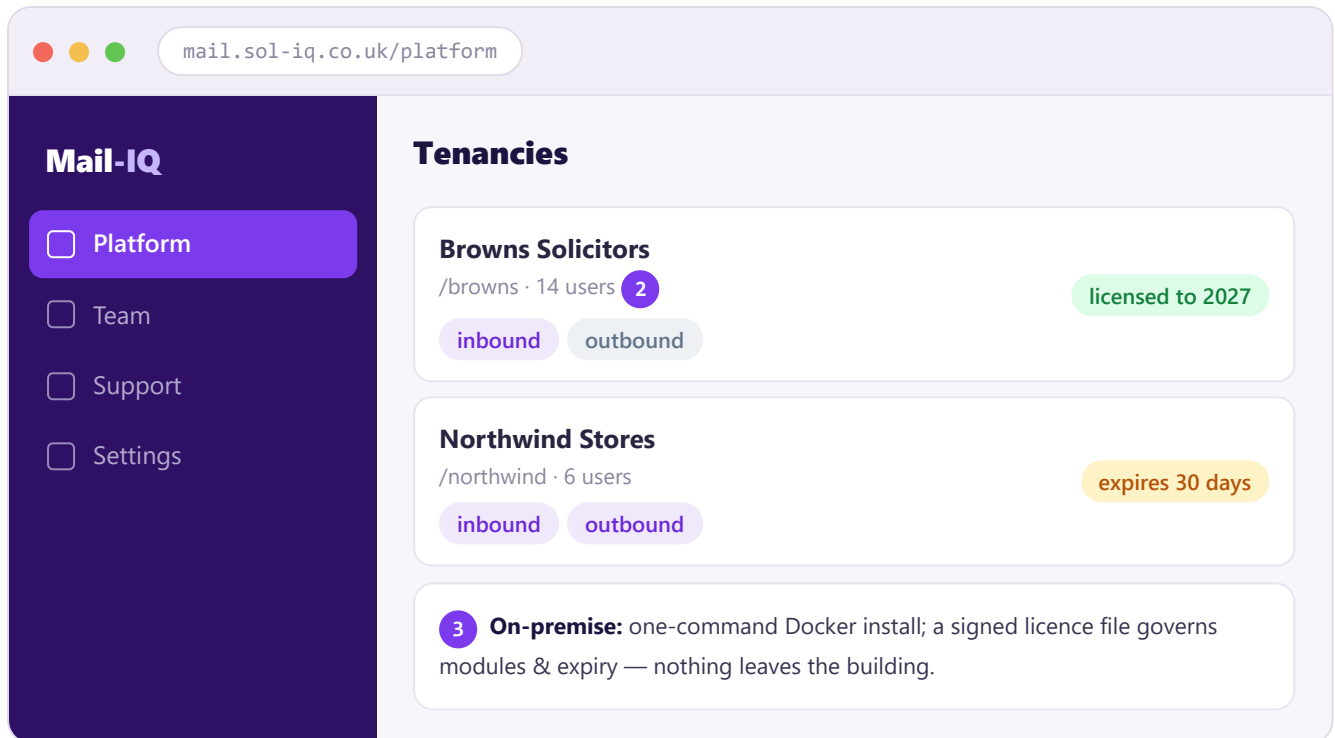

- 1 Posted back → scanned.** A returned ballot goes through the same inbound scanner; Mail-IQ reads its QR and marks that member as **returned** — no data entry.
- 2 Online → uploaded.** A recipient who used the portal is marked **uploaded** — the same status, from the digital channel.
- 3 One reconciliation.** Sent, delivered by each channel, and returned — all on one dashboard. For ballots, AGMs, consent or renewals, that's the whole job.

Why it matters: most systems can send mail; very few can tell you what came back. Mail-IQ closes the loop across both paper and digital, so response chasing stops being a spreadsheet exercise.

Multi-tenant, module-licensed, and available on-premise

Run Mail-IQ for many customers, each in their own isolated tenancy, licensed for the modules they've bought. For compliance-sensitive customers, the whole platform installs inside their network with a signed, tamper-proof licence.

1 Provision in seconds. Create a clean tenancy with its first administrator; issue, extend or switch off a customer's licence from one screen.

2 Module licensing. Sell Inbound, Outbound, or both — a locked module is still visible, with a prompt to enable it, so the upsell is built in.

3 On-premise edition. The same product runs entirely inside a customer's network, gated by a cryptographically signed licence — for firms that can't use the cloud.

See Mail-IQ running on your own post

Happy to give you a live walkthrough or set up a trial — inbound, outbound, or the whole loop. Just get in touch.
